Approximation Theory - Universal Approximation -
claim: Perceptron is Turing equivalent

- A computational machine is Turing equivalent if it can compute anything that can be computed by a Turing machine - a simple computing machine (aka Turing machine) that can compute anything so long as it has enough memory.
- Hence, the idea is that a Turing equivalent machine can compute anything another computer can compute.

pf: Make Perceptron = NAND gate $x_1, x_2 \rightarrow V_{out}$

- A computer can be constructed entirely from NAND gates.

ex: NOT gate $x_1 \rightarrow V_{out}$

OR gate $x_1, x_2 \rightarrow V_{out}$

• 3 perceptrons used

RS Flip-Flop $\bar{S}=x_1, \bar{R}=x_2 \rightarrow Q, \bar{Q}$

NAND gate

x_1	x_2	V_{out}
0	0	1
0	1	1
1	0	1
1	1	0

• Note: Our Perceptron NAND gate will also give binary V_{out} when x_1, x_2 are not binary, e.g. $(x_1, x_2) = (\frac{1}{2}, \frac{1}{2})$ might give $V_{out} = 1$.

$$\vec{w} = (-1, -1)$$

$$|\vec{w}| = \sqrt{2}$$

$$w_0 = \frac{3}{2}$$

Perceptron is Turing Equivalent (cont.)

check: $(x_1, x_2) = (0, 0)$

$$u = 1 \cdot w_0 + x_1 w_1 + x_2 w_2 = 1 \cdot \frac{3}{2} + 0 \cdot (-1) + 0 \cdot (-1) = \frac{3}{2} > 0$$

$$\therefore V_{out} \equiv g(u) = 1 \quad \text{since } u > 0 \quad \checkmark$$

$(x_1, x_2) = (0, 1)$

$$u = 1 \cdot \frac{3}{2} + 0 \cdot (-1) + 1 \cdot (-1) = \frac{3}{2} - 1 = \frac{1}{2} > 0$$

$$\therefore V_{out} \equiv g(u) = 1 \quad \text{since } u > 0 \quad \checkmark$$

$(x_1, x_2) = (1, 0)$

$$u = 1 \cdot \frac{3}{2} + 1 \cdot (-1) + 0 \cdot (-1) = \frac{3}{2} - 1 = \frac{1}{2} > 0$$

$$\therefore V_{out} = 1 \quad \checkmark$$

$(x_1, x_2) = (1, 1)$

$$u = 1 \cdot \frac{3}{2} + 1 \cdot (-1) + 1 \cdot (-1) = \frac{3}{2} - 1 - 1 = -\frac{1}{2} < 0$$

$$\therefore V_{out} = 0 \quad \text{since } u < 0 \quad \checkmark$$
